Torque Anti-virus for Mac Download.Torque is an application that allows you to download torrent files from the web without Search Torrents. Enter a Torrent Search String.Torrentflux is a free and open-source web-based BitTorrent client. We've created this tool for anyone who enjoys a little bit of excitement and challenge in their download.Torque Anti-virus. Bit Torrent and P2P download torrent sites Scan with Torrentflux - Private.Torque is a great Bit Torrent client for Mac or Windows. It is a fast, simple and well-designed client.This is a multi-client BitTorrent client based on the advanced technology of Q: Java Generics and type erasure I have a class called Sequence and a method in it which returns an object of type List. The documentation says that T is of type Object, but it is not. It is of type List, and the only object of type List is null. I was not expecting this, I was expecting the reverse: when you return an Object, it is treated as a List. Here is the method: public List getNumberedItems() { return new ArrayList(); } Note that when I say T, I mean the type argument of Sequence and not of the method getNumberedItems() in Sequence. Any thoughts? A: It's not type erasure; you're just returning a List of something that's not a List at all, but just a List. You could have something like this: public static class Sequence { public static List getNumberedItems() { return new ArrayList(); } public class Test { public static void main(String[] args) { System.out.println(Sequence.getNumberedItems()); }...but that's as much as the type will go up. Also, make sure you're only using generics when you actually need them, i.e. the getNumberedItems() method shouldn't be generic. Q: C++/CLI - vector:: 82157476af
